Tiny Fixture Paper on Citation Checking

ABSTRACT

We describe a small fixture document used to test PDF extraction. It has a few short paragraphs, headings in capital letters, and wrapped lines so that paragraph reconstruction can be exercised end to end.

1 INTRODUCTION

Citations generated by language models are often plausible but unsupported. Checking each one by hand is slow, so we automate the first step: fetching the cited paper and storing its text in retrievable chunks.

The second paragraph of the introduction notes that hyphenated words like transfor-
mer should be rejoined when a line break splits them.

2 RESULTS

The fixture contains exactly three headings and four body paragraphs.
